

Dead Letter Wake: Relay Continuity Memorandum

Introduction

This memorandum records the continuity procedure used after the research vessel Sable Meridian stopped answering routine relay checks. The process preserves the last authenticated instruction without depending on the vessel's failed uplink.

Background Information

At 02:30 UTC the shore relay accepted a numbered sequence from the vessel's watch account. Most deliveries remained visible in the packet recorder, while one crossed an encrypted transport boundary and was retained only in deferred queue state. The message series must be restored before its contents can be trusted.

Objective

Recover the final wake authorization, verify that every numbered component belongs to the same message identity, and preserve the resulting document as evidence. Any value copied from an incomplete sequence is to be treated as a training artifact.

Strategy Overview

The recovery team will correlate wire traffic with the relay's queue journal, rebuild the original MIME entity, and examine the attached authorization memorandum. The document export service applied a mosaic filter before discarding its source text; the retained calibration capture is the only supported reversal reference.

Execution Plan

Phase 1: Correlate Deliveries

Group partial messages by their MIME identity and number. Use the encrypted session's endpoint and time to identify its deferred queue record rather than attempting to recover transport secrets.

Phase 2: Restore the Message

Join the seven raw partial bodies in sequence and parse the result as a new MIME message. Preserve the attached PDF exactly; rendering or recompression changes the mosaic block averages.

Phase 3: Validate Continuity

Extract the document's raster objects losslessly. The PIX-8 target and its same-renderer calibration capture use gamma-encoded RGB averages and must be handled as original-resolution images.

Conclusion

A successful recovery proves that the final instruction survived both the missing wire fragment and the document export service's unsafe visual redaction.

Appendix: Recovery Authorization

The authorization key below was mosaiced before the source text layer was discarded. The pale acquisition bands are part of the target crop.

authorization 

Calibration capture - PIX-8 / gamma-encoded RGB / same renderer / do not resample
